

## VTT Brake Kit Fitting install warning

PLEASE NOTE: These kits use 1/8" NPT pipe threads in the calipers, if they are not installed correctly, they WILL leak. You MUST use a good thread sealer such as Permatex 56521, and you must tighten the fitting properly. Please bear in mind, pipe threads are a "taper" threads, and they seal by interference. The fitting will NOT thread all the way in, usually only 3-5 threads, and they will become tight as they bind on the taper. Use a 1/4" ratchet, and ensure they are TIGHT while using the proper sealant. Failure to do this WILL again result in fluid leaks at the fitting. Having a proper understanding of taper threads will help you to understand this procedure.
